

Welcome to the UML2Merode Converter!

This is a short tutorial to help you get started with the UML2Merode Converter Tool. Before we start with the tool itself, we would need to get our Input. For a fast start I have already provided the “building management.xmi” File, which was modelled with the “Modelio Open Source Tool 5.4”. You can also use any other Tool as long as the input file format is “.xmi”.

Introduction

The provided file is a UML Class Diagramm which depicts a possible information system design for building management web portal. The main parts here are the users and administrators, the buildings and their properties, as well as the Web portal itself and the linked entries. Your final task should be to do a full transformation of the given UML-CD into a valid Merode EDG Model using the UML2Merode Converter Tool. The tool already suggests some parts for the transformation, but you still need to check all proposals and make reasonable assumptions for the transformation where necessary. In the next part I will explain the tool and its functionalities, for a better understanding you can also watch the video tutorial that I posted on the GitHub of this project: [tutorials/Tutorial Video.mp4](#) (To watch it you need to download it first).

Using the tool

Our tour begins on the Welcome Page, which serves as your starting point. Here, you can easily upload your XML diagram file by dragging and dropping it into the upload area to initiate the conversion process.

Once your file is successfully uploaded, you will be directed to the main editing workspace. This interface is divided into several key sections to help you manage your model.

In the large main area, you will find the Diagram Section. This space visually represents your models, displaying both your initial UML structures and the resulting MERODE diagram components.

At the top or side of the screen, you will notice a set of Action Buttons. These tools provide you with the necessary options to control, adjust, and interact with your diagrams throughout the process. To get more information, just hover over the icons.

Finally, please direct your attention to the Open Proposals panel. This is a crucial part of the conversion workflow. The tool automatically analyzes your uploaded diagram and generates specific recommendations, such as how to resolve binary associations or which business

events to filter. You should carefully review each of these proposals and click "Accept proposal" to actively apply them to your final model.
